MODULE 10: CAPSTONE PROJECT

Integration Sprint : Participant Instruction Sheet

Background

You have been assigned a real-world business challenge.

The scenario you received reflects a situation faced by many growing organizations across industries, including oil & gas, services, logistics, and community-based enterprises.

Your task is to respond as an entrepreneurial project team brought in to solve the problem.

This is not a theory exercise.

This is a practical integration sprint.

Your Mission

Over the course of the sprint, your team must:

- Diagnose the business situation
- Identify what is missing or failing
- Design a practical solution
- Build the systems needed to support execution
- Present a clear implementation plan

You are expected to apply everything you have learned throughout the program.

Key Challenge

The problem statement will not tell you what tools to use.

You must determine:

- What the real problem is
- What the business needs
- What structure must be created
- What solution is realistic within the context

Your team will be assessed on how well you identify and integrate the right components.

Team Expectations

Each team must operate like a professional venture or consulting unit.

You are expected to demonstrate:

- Strong collaboration
- Clear division of responsibilities
- Evidence of teamwork and communication
- Structured decision-making

Project Outputs (Required Deliverables)

By the end of the sprint, every team must submit the following:

1. Situation Diagnosis Report

A short document explaining:

- What the core problem is
- Why it is happening
- What risks exist if nothing changes

2. Proposed Solution & Business Model

Provide a clear description of:

- Your recommended solution
- Who it serves
- How it works
- Why it is sustainable

3. Minimum Viable Implementation (MVI)

Your team must produce a practical demonstration such as:

- A prototype
- A service workflow
- A process redesign
- A customer pipeline
- An operational system

This must be realistic and usable.

4. Customer & Stakeholder Management System

Show how the organization will:

- Track customers or stakeholders
- Manage relationships
- Follow up consistently
- Improve retention and satisfaction

5. Customer Experience Journey

Provide a simple map or explanation of:

- How customers currently experience the service
- What improvements you propose
- How trust and satisfaction will increase

6. Knowledge & Process Structure

Your solution must include:

- Documented processes or SOPs
- Clear internal workflows
- Knowledge transfer mechanisms

The business must not depend on “one person’s memory.”

7. Project Execution Plan

Develop a delivery roadmap that includes:

- Key milestones
- Timeline
- Resources required
- Risks and mitigation steps

8. Final Presentation (Demo Day Pitch)

Each team will present:

- Problem summary
- Solution and justification
- Demonstration of outputs
- Implementation plan
- Expected impact

Clarification Rule

Your team may ask up to **10 clarification questions** during the sprint.

Use them wisely.

Teams that ask better questions demonstrate stronger problem-solving ability.

Evaluation Criteria

Teams will be assessed on:

- Depth of problem understanding
- Practicality of the proposed solution
- Quality of systems designed
- Evidence of integration across learning areas
- Team collaboration and professionalism
- Clarity of documentation and presentation
